

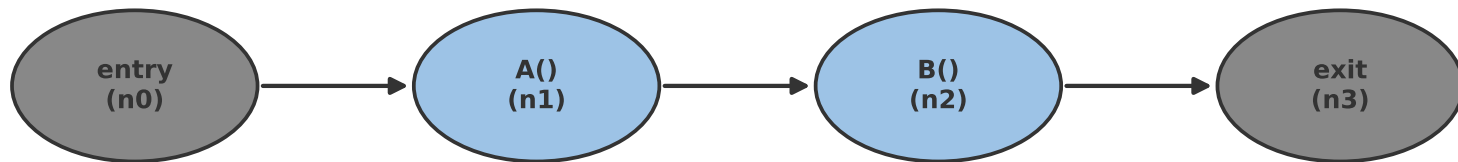

Figure 6.6 -- Worked alive-extension example: entry -> A() -> B() -> exit, checking $G(!B)$

No cycle -- dead-ends at exit (n3). property checked: $G(!B)$

Pre-fix

No acceptance condition set.
Empty omega-language ->
COMPLIANT (vacuous), even
though B provably executes.

Post-fix

Negate spot::from_ltlf(phi,
"alive") against an alive-
extended copy -> VIOLATION,
unmatched_atoms: [].

Real-build confirmation (E2E Integration Verification Findings.md): identical result on uid 44's extracted WIR -- a genuine, total task-order reversal -- correctly flips to VIOLATION.
